Summary

Problem

The U.S. Air Force Medical Support Agency, Surgeon General Support Logistics Office requested that the Naval Health Research Center (NHRC) use its Estimating Supplies Program (ESP) to develop and manage the Allowance Standard (AS) for its Gynecological Treatment Team (FFGYN) Unit Type Code. The desired end was to baseline the FFGYN medical capability as a specialty augmentation unit assigned to an Expeditionary Medical Support (EMEDS) Air Force Theater Hospital while in support of missions like Small-Scale Contingency and humanitarian operations.¹

Objective

The primary objective of this study was to build a model that constitutes a baseline for a gynecological medical capability for use as an augment to the EMEDS System+10 or EMEDS+25. This would give those sized theater hospitals the ability to diagnose and treat acute and nonacute gynecological conditions in a deployed setting. Medical support that the EMEDS+10 and EMEDS+25 would likely need to provide the FFGYN was also identified.

Method

A detailed study was completed of clinical requirements, the operating environment in which the FFGYN deploys, and its mission scope. After analyzing these elements, NHRC was able to recommend a range of patient conditions (PCs) that the FFGYN would treat and their concomitant clinical and nonclinical procedures. To determine probabilities and frequencies for each PC the FFGYN module might be expected to treat, these findings were presented to a panel of subject matter experts (SME), to the Air Combat Command Manpower and Equipment Force Packaging System (MEFPAK), and to the MEFPAK Responsible Agency.

A panel of gynecological and logistical SMEs convened 14-18 May 2007 at the Royal Air Force base in Lakenheath, UK, to discuss and review PCs, clinical tasks, and appropriate medical equipment and supplies. A Form, Fit, Function evaluation was also conducted, to which NHRC's modeling contributed significantly. The inventory evaluation entailed an in-depth review of supplies and equipment. With SME input, revisions were made. For each PC included in the capability's task profiles were identified and supplies were assigned to each task.

Results

A comprehensive list of patient conditions (PCs) with clinically based requirements was developed. Task profiles based on the mission capability statement were aligned with supplies and equipment, then reviewed and discussed. Three new PCs and seven new tasks were developed to complete the full range of PCs that might be treated by the FFGYN module. Identifying FFGYN core capabilities could validate future gynecological requirements and assist with a review of the AS for planning and training for future deployments.

The resulting materiel configuration satisfies the operational and clinical components of the Air Force Tactics, Techniques, and Procedures for the Medical Gynecological Treatment Team.

Introduction

Background

The Air Force has been involved in an increasing number of Small-Scale Contingency and humanitarian relief operations, highlighting its need to develop highly mobile, expeditionary medical treatment facilities (MTFs). Concurrently, the U.S. Armed Services are developing military medical systems to satisfy the Joint Chiefs of Staff *Vision 2010* concept of providing greater expeditionary mobility and dispersion with a smaller logistical footprint.² The MTFs were conceived as modular capabilities that range from routine outpatient care to the treatment of critically injured or ill personnel. Specialties that increase the range of medical conditions a capability might treat could subsequently be added as building blocks to deploy as needed. Optimally, this would facilitate configuring materiel to maximize utility without sacrificing the ability to provide care. Guidance provided by the Joint Chief's of Staff *Vision 2020* calls for using a scientific approach to leveraging and enhancing existing information technologies that support modern operational capabilities.³

The Air Force sought a more precise and efficient method for determining medical readiness, a methodology for creating flexibility and mobility without losing clinical capability. Under the aegis of the Marine Corps Systems Command, NHRC had an established methodology for creating medical capabilities and maintaining their inventories, by conducting readiness reviews. Through this process, NHRC developed a medical requirements model and supporting database called the Estimating Supplies Program (ESP),⁴ a primary source of data for the Joint Common User Database developed by the Defense Medical Standardization Board (DMSB) for Level 1 and 2 clinical tasks. The database consists of PCs and clinical tasks mapped to supplies required to complete those tasks, linking each supply with a clinical requirement. Every supply in the inventory is therefore necessary and accounted for by virtue of its attachment to a patient treatment profile. ESP was used to develop and streamline Marine Corps medical capabilities such as the Forward Resuscitative Surgical System (FRSS)⁵ and the En Route Care System (ERCS).⁶

To begin the process of developing modular medical capabilities, the first step is to establish a baseline for a medical system clinical capability by aligning it with its mission requirements. In the Air Force Theater Hospital system, EMEDS is the main medical asset deployed in support of a variety of military missions, with an emphasis on treating injuries and illnesses associated with war. Specialty augmentation units are assigned to the EMEDS system, to bring increased surgical and support capability. The U.S. Air Force Medical Support Agency, Surgeon General Support Logistics Office (AFMSA/SGSLX), asked NHRC to build models that establish a baseline inventory for its Unit Type Codes (UTCs). To date, NHRC has reviewed the Mobile Forward Surgical Team (MFST),⁷ the Critical Care Air Transport Team (CCATT),⁸ the Global Reach Laydown (GRL),⁹ and the Air Force Four-Bed Critical Care Unit (FFCCU),¹⁰ Oral Surgery Augmentation Team (FFMAX),¹¹ Pediatric Augmentation Team (FFPED),¹² and Otolaryngology Team (FFENT).¹³

The present study outlines the process of developing the model for the FFGYN UTC.¹⁴ An FFGYN unit can be assigned to an EMEDS+10 or an EMEDS+25 without the full complement of specialty UTCs. Identifying core FFGYN capabilities would validate future clinical requirements and provide a baseline for an Allowance Standard (AS) review when planning and training for future deployments.

As with the other Air Force UTCs for which models were built, a simulation package was created for the FFGYN UTC using ESP's underlying relational database structure. The structure, shown in Figure 1, outlines the associations made between PCs, tasks, and related supplies. In this case, *PC 118, Wound External, Genitalia Female Severe-Lacerated, Avulsed, Crushed*, is aligned with tasks specific to administering care for that condition. The final column lists the supplies required to carry out those tasks. Using this process yields a supply inventory that is specific to the mission capability requirements.

PC Code	Taxonomy of Care	Functional Area	Task	% of Patients	Supplies

Capability Statement for the Gynecological Medical Treatment Team

Mission

The mission of the Medical Gynecology Treatment Team is to provide gynecological support to diagnose and treat acute and nonacute conditions in a deployed setting. It provides gynecological services and limited emergent obstetrics capability. It is not a stand-alone capability, and must be attached to an EMEDS+10 or an EMEDS+25. It contains enough supplies for a 30-day operation without resupply. The patient population it supports includes primarily U.S. and coalition forces; however, depending on the mission, it might also include local civilian populations. Possible mission scenarios include wartime support of U.S. and coalition forces, small-scale or lesser contingency operations such as natural and manmade disaster response, humanitarian relief, peacekeeping, or peace enforcement.

Capability

The FFGYN triages and manages routine and potentially life-threatening gynecological conditions of deployed military forces. It is prepared to provide intervention for and treatment of sexually transmitted diseases (STDs) and other gynecological complaints, sexual assault evaluations, and counseling for contraception and contraceptive use. The team might assist in the surgical care and management of battlefield-related abdominal, pelvic, and gynecologic injuries, or evaluate and treat conditions like cervical dysplasia with colposcopy and cervical conization (loop electrosurgical

excision procedure [LEEP]), but has only limited capability for incidentally encountered life-threatening obstetric emergencies.

Personnel

Manpower for the FFGYN medical capability consists of one staff obstetrician/gynecologist, one women's health nurse practitioner, one clinical obstetric nurse, and two aerospace technicians.

Materiel

The only pharmaceuticals an FFGYN carries are an initial 30-day supply used for obstetric emergencies, neonatal resuscitation, STD treatment, and contraceptive management. The unit would rely on EMEDS+25 pharmacy support once the initial supply is depleted and to treat any other medical conditions. Additional supplies not carried in the FFGYN assemblage are available through the supporting Laboratory/Pharmacy/Radiology augmentation units. Base operational support is required, similar to that required by EMEDS.

Methodology

The NHRC method of modeling medical materiel requirements was developed to establish and/or review Authorized Medical Allowance Lists (AMALs), equivalent to the Air Force AS, for various Navy and Marine Corps medical capabilities. NHRC's aim is to give medical personnel the materiel they need to provide the best possible care, while maintaining a minimal logistical footprint, and to continue with the ongoing transformation of new capabilities, as mandated by the current *Joint Vision 2020*.

The ESP relational database was derived from Time, Task, Treater (TTT) files originally developed by the DMSB for Level 3 MTFs. NHRC adapted the TTT files to model both Navy and Marine Corps Level 1 and 2 facilities, updating ESP data monthly to reflect changes in medical equipment and supplies. Functional areas within each capability are also routinely updated, using subject matter expert (SME) input and military medical lessons-learned data, to remain current with changes in field care and joint doctrine. As mentioned, NHRC is the primary contributor of Level 1 and 2 data to the DMSB Common User Database, which is the reason ESP was chosen as the primary data source for this study (telephone conference with DMSB, AFMSA/SGSLX, and NHRC, 7 July 2005). A comprehensive description of ESP's background, capabilities, uses, frequently asked questions, and a download link is available at: <http://www.nhrc.navy.mil/programs/esp/index.html>

The methodology is to create an appropriate patient stream consisting of a group of PCs likely to be treated, as set out in the mission Concept of Operations (CONOPS) of the UTC. Using the TTT files, clinical tasks can be mapped to each condition. Once the tasks and PCs are mapped to one another, supplies can be associated to tasks, and the lists of equipment, medications, durables, and consumables can be assessed for suitability. An SME panel rigorously reviews and evaluates each step of this process to ensure every inventory meets operational and medical needs.

Patient Stream Generation

Using ESP, the study team developed a patient stream representative of the PCs that an FFGYN team would likely treat in a 30-day period. They assumed that not all the PCs would be seen in those 30 days, but that they might present over a protracted length of time. The

patient stream they assembled comprised 12 surgical patients and 166 outpatients. A panel of SMEs then vetted this group of likely PCs. Even though not all PCs are seen within the 30-day period, all clinical and nonclinical tasks are included in the patient stream used for the simulation, and all supplies were used at least one time.

Patient Conditions

A range of 20 PCs from the NHRC ESP database and the DMSB T³IT files were added to the model, based on the capability requirements from the Air Force Medical Services CONOPS.¹¹ Three additional PCs were developed and evaluated by an SME: *Examination (Routine, General)*, *Endometriosis*, and *Pregnancy*. Table 1 lists the PCs and the approximate percentages in which they are seen in Outpatient, Surgery, or both.

Tasks

There are 59 clinical and nonclinical tasks associated with PCs for this UTC. Tasks such as *1010 Hysterectomy*, *411 Vulva and Perineum-Repair Wound*, *413 Dilation and Curettage*, and *414 Salpingectomy*, were pulled from the TIT files. New tasks were developed to account for gynecological procedures not previously modeled but considered appropriate to the UTC, and they include *Z001 Colposcopy*, *Z002 Pap Smear*, *Z003 Removal IUD/Diaphragm*, *Z004 C-Section*, *Z005 Normal Delivery*, *Z006 IUD/Diaphragm Placement*, and *Z008 Neonatal Care*. One specialty surgical set was built: *Z007 Issue Basic Obstetric*. The comprehensive list of clinical and nonclinical tasks performed by the GYN UTC is shown in Table 2. Appendix A contains a complete profile of tasks and supplies.

Results

A group of SMEs from the 48th Medical Group gathered at RAF Lakenheath, UK, to discuss PCs, tasks, and appropriate medical equipment and supplies. The panel included 2 OB/GYN physicians, 1 women's health practitioner, 1 OB/GYN clinical nurse, and 2 aerospace medical technicians.

A Form, Fit, Function evaluation was conducted with the FFGYN team. Patient scenarios were presented to identify tasks and supplies required to support the PCs. Following a walk-through to discuss the PCs, tasks, and AS, results noted by the observers were reviewed. Incorporating SME input, a model was constructed using a patient stream consisting of 166 patients seen in an outpatient setting and 12 patients with injuries requiring surgical repair by an FFGYN specialist. Next, utilizing ESP, the patient stream was run through the simulation with the AS to determine a usage rate for each item. This process produced an inventory based solely on clinical requirements,

since ESP predicates materiel requirements for a patient stream on per-patient consumption of an item.

Because ESP associates patients with tasks and maps tasks to supplies necessary to carry out the tasks, the recommended changes to the FFGYN AS are based on clinical requirements. The results indicate an 8.81% decrease in overall weight, a decrease in cube by 27.70%, and a cost increase of 0.85%, which amounts to \$2364.68. Modeled cost for the FFGYN UTC is \$281,674.58. Evaluating the patient stream through an FFGYN SME panel could further validate the usage rate. Table 3 shows a brief overview of the changes by category, while Appendix B presents a line-item view by weight, cube, and cost of the FFGYN AS inventory as it stands now, comparing it side by side with the changes recommended by ESP.

PERCENT CHANGE	-8.81%	-2.03%	0.85%

The cost increase of \$2,018.78 was due primarily to medications. The ESP scenario stipulated that the clinical requirement for more than 45 patients requiring treatment and prescribed medications for fungal or bacterial infections would increase the supply of *Metronidazole Gel Vaginal Tube* from 10 to 22 tubes, and *Clindamycin Phosphate Vaginal Cream* from 10 to 21 tubes. In addition, more than 50 patients requiring a prescription of *Ketorlac Tromethamine 30mg/ml* for pain management increased that inventory from 4 packages of 10 to 12 packages of 10. The increased use of *Ferric Subsulfate Solution* from 2 to 13 bottles was based on providing treatment for iron deficiency to more than 12 patients.

ESP noted that clinical requirements for more than 170 patients over a 30-day period would require less than the quantity stated in the AS for 5 different types and sizes of exam gloves. This meant that instead of 10 packages of 100 of each type of glove, only 1 package of each type was necessary. It was also possible to reduce the number of packages of glass microscope slides from 10 to 2, since each package contains 140 slides.

The most notable inventory change was the decrease in durables. Durables decreased in weight by 66.81% (91.35 lb), in cube by 79.33% (17.98 cubic feet), and by 10.16% in cost (\$21.67). The most significant decrease in durables was the *Blanket Infant Receiving*. Based on the assumption that the FFGYN UTC has a limited capability for emergency obstetrics and for incidentally encountered obstetric emergencies, allowing one blanket per delivery meant the inventory of blankets could be reduced from 36 to 2.

Line items that are required in addition to the FFGYN AS in support of tasks described in the Air Force Tactics, Techniques, and Procedures for neonatal resuscitation are supported by the EMEDS Allowance Standard 937A. One item not carried in the EMEDS inventory, the *Paddle Defib Ped ext U/O STD Adult Paddle, 2s*, is available in the FFPED Allowance Standard 917D and is a recommended addition to the EMEDS AS.

Discussion and Conclusion

Simulation of the inventory was performed using a patient stream of 178 patients who represented 23 PCs. Those PCs were then associated with 59 tasks, either surgical or nonsurgical, patient visits. Tasks were derived from existing ESP data, and if necessary, new tasks were developed along with the frequencies with which they were performed. Supplies were then mapped to the tasks, and quantities of each item were evaluated and assessed. The process and its findings were validated by SMEs. Now that the UTC has been baselined, future reviews and modernization of the FFGYN AS can be assessed.

Once a review by an Air Force SME panel has been completed, recommended configuration changes to the existing UTC (additions, deletions, and quantity changes) can be made to the AS. During this review process, ESP will be available for an Air Force SME panel to align any materiel items with those specific clinical tasks and PCs they are intended to support. This phase will be completed at the discretion of the Air Combat Command MEFPAK. Identifying core capabilities of the FFGYN may validate future gynecological requirements and assist with a review of the AS for planning and training for future deployments.

ESP is an invaluable resource when building a new AS or when modernization calls for modifying an existing one. ESP can determine the materiel requirements for emerging systems and has been used to develop numerous systems for the Navy and Marine Corps, including the FRSS and the ERCS, currently fielded and deployed in support of troops. This program is essential to configuration management because a planner is able to see the impact of deleting an item across a spectrum of tasks performed in a given functional area. Moreover, SMEs can review task profiles to determine if a task is considered critical, and, if not, the treatment profile can be modified. The same concept holds true for supplies; SMEs can review the supplies for a specific task and make clinical judgments, such as whether a line item can be removed from a task or if it needs to be reduced or increased in quantity.

Estimating supplies required for the FFGYN is critical for a mobile, transportable system. ESP is also a highly effective tool with which to configure resupply packs, ensuring medical materiel sustainment across a spectrum of medical care facilities, while maintaining their clinical capability. It also serves as a leading consumption indicator, making it easier to identify resupply requirements to ensure adequate sustainment of this UTC.

Using ESP provides the Air Force an avenue with which to assist standardization within its theater hospital capabilities as well as across the services. Other complex contingencies such as a humanitarian relief or peace operations require a rapid, flexible response to achieve national objectives in a specified time frame. Some situations might require the capabilities of only one military service, but in most cases, a joint force composed of both active and reserve components will likely be employed.

Finally, the ESP simulation creates an audit trail establishing clinical requirements for supply items in medical system inventories that enable logisticians, medical planners, and MEFPAK members to validate current inventories and perform analyses of projected changes to future ones.

Acknowledgments

We would like to express our appreciation to General Dynamics, Inc., Vienna, VA, and Science Applications International, Inc., San Diego, CA, for their support in this effort.

REPORT DOCUMENTATION PAGE

The public reporting burden for this collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing the burden, to Washington Headquarters Services, Directorate for Information Operations and Reports, 1215 Jefferson Davis Highway, Suite 1204, Arlington, VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to any penalty for failing to comply with a collection of information if it does not display a currently valid OMB Control number. **PLEASE DO NOT RETURN YOUR FORM TO THE ABOVE ADDRESS.**

14. ABSTRACT (maximum 200 words)

The U.S. Air Force Medical Support Agency, Surgeon General Support Logistics Office, requested that the Naval Health Research Center (NHRC) conduct a proof of concept study to assess the validity and feasibility of using NHRC's medical modeling tool for the development and management of Air Force medical Allowance Standards as a baseline for standardization throughout the services.

The primary objective of this study was to provide the Air Force with the ability to validate the clinical requirements of the Medical Gynecological Treatment Team. The Air Force Allowance Standard (AS) addresses the equipment, medicines, consumables, and durables required for a 30-day period.

This study was accomplished in two phases. The first phase entailed an understanding of the mission capability requirements in order to (1) understand the operating environment in which the Gynecological Unit Type Code AS is employed, (2) determine the level of care it supports, (3) develop the range of patient conditions the AS must be capable of treating, and (4) better understand its mission scope. Concurrently, NHRC initiated e-mails, teleconferences, and face-to-face meetings with subject matter experts to determine the likelihood of each patient condition occurring.

In phase two, following the NHRC process of modeling clinical requirements for field medical facilities, the Estimating Supplies Program database of medical task and supply profiles was used as a template to identify patient conditions appropriate to this capability and to match gynecological supplies to clinical tasks, medical equipment, and supplies.
